THE MIND-EXPANDING IDEAS OF ANDY CLARK

The tools we use to help us think—from language to smartphones—may be part of thought itself.

By Larissa MacFarquhar

“There’s something very interesting about life,” Clark says, “which is that we do seem to be built of system upon system upon system. **The smallest systems are the individual cells, which have an awful lot of their own little intelligence, if you like—they take care of themselves, they have their own things to do.** Maybe there’s a great flexibility in being built out of all these little bits of stuff that have their own capacities to protect and organize themselves. I’ve become more and more open to the idea that some of the fundamental features of life really *are* important to understanding how our mind is possible. I didn’t use to think that. I used to think that you could start about halfway up and get everything you needed.”

Not all neurons are created equal:

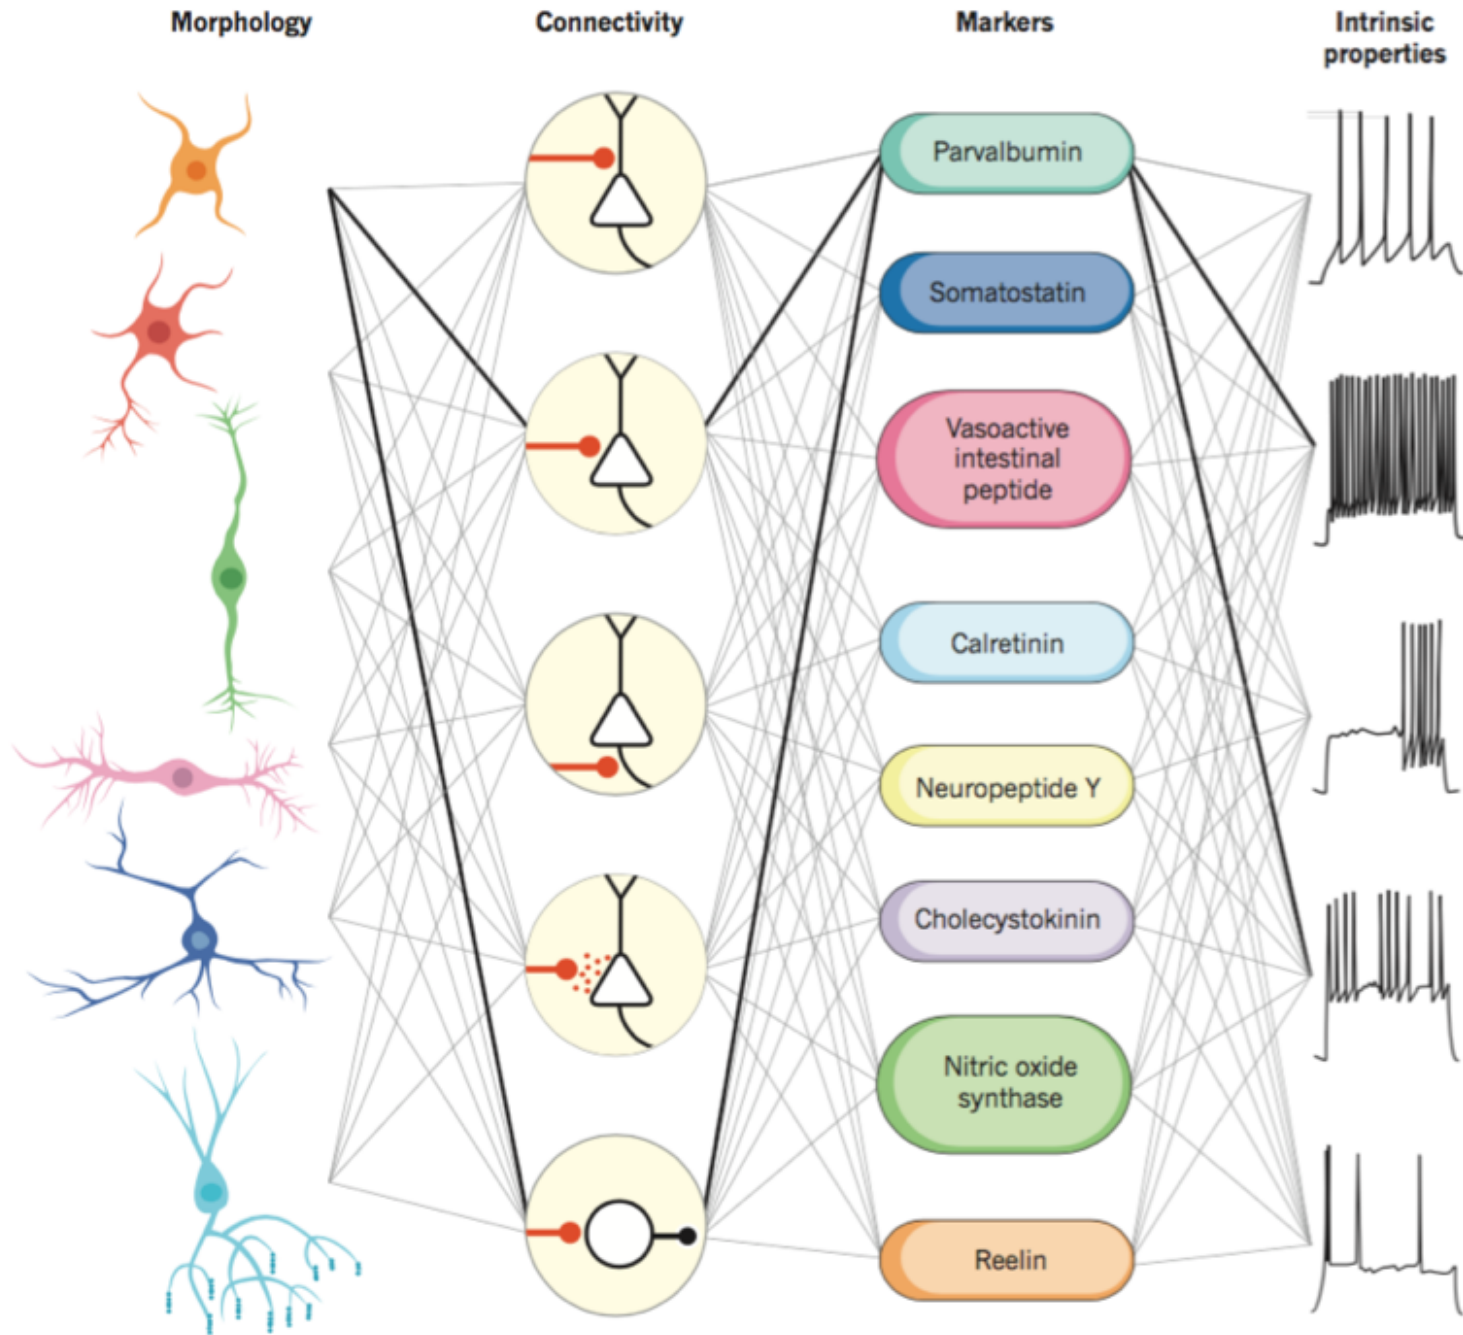

Drawing of auditory cortical neurons, Ramón y Cajal (1899)

Fluorescently labeled neurons and glia, Livet, Sanes, and Lichtman (2007)

Each neuron has a unique:

1. Location (area, layer)
2. Connections (inputs, outputs)
3. Electrical and chemical responses

SAME BUT DIFFERENT

How epigenetics can blur the line between nature and nurture.

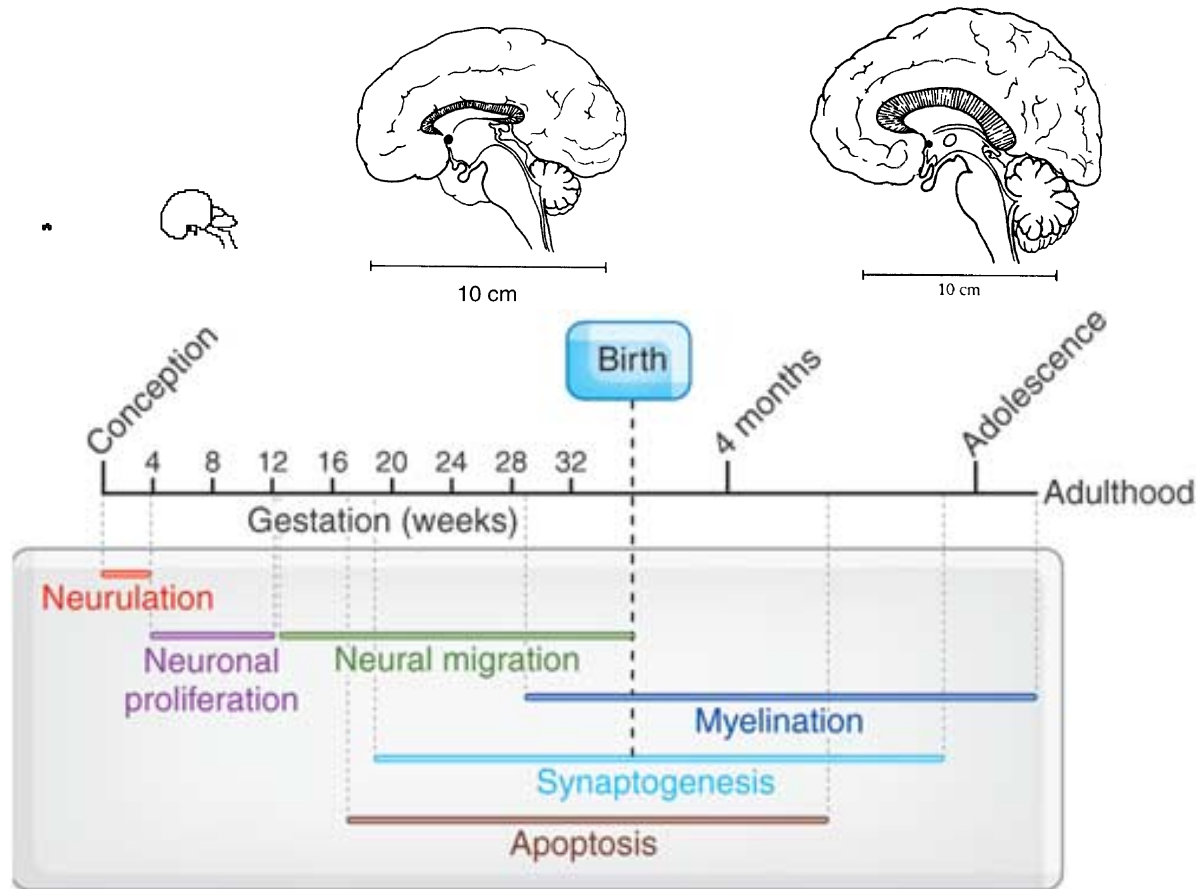

BY SIDDHARTHA MUKHERJEE

The author's mother (right) and her twin are a study in difference and identity.

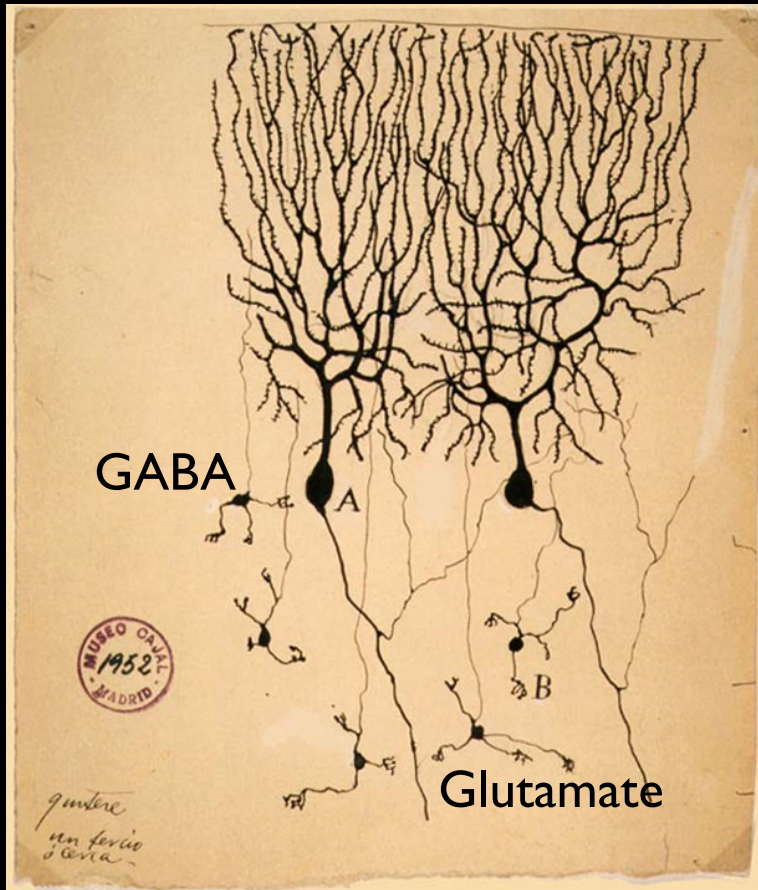

How do cells acquire, maintain and adjust their diverse characters?

Brain development: A tightly orchestrated process

Tau and Peterson, B.S. *Neuropsychopharmac.* (2009).
S.L. Anderson. *Neurosci. and Behav. Rev.* (2003)

Puzzle: Different cells, same genome...

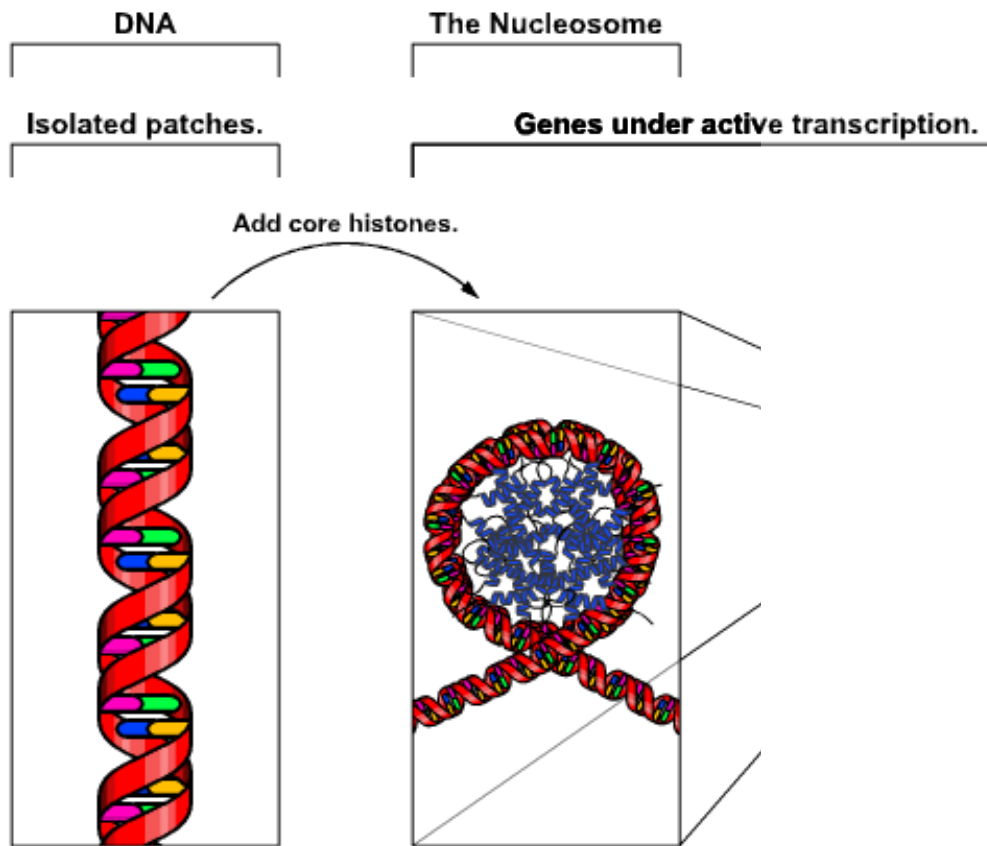

Drawing of pigeon cerebellar Purkinje and granule cells, Ramon y Cajal (1899)

Same genome

Multiple mature phenotypes

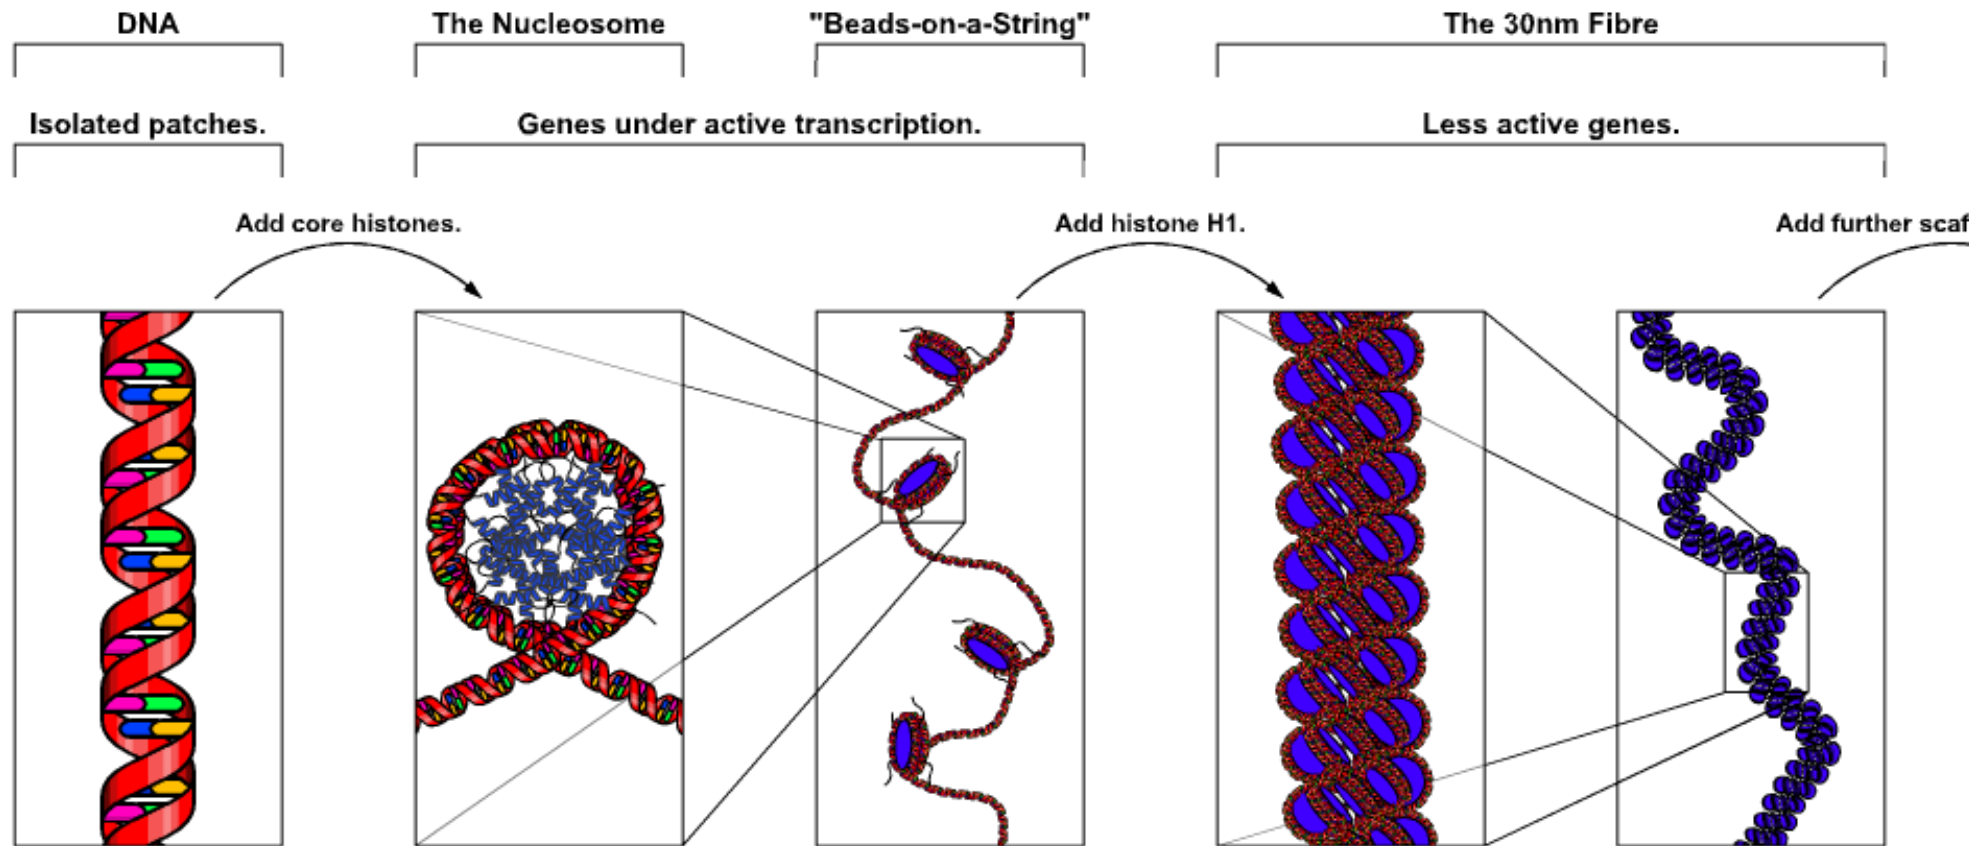

Levels of organization in the genome

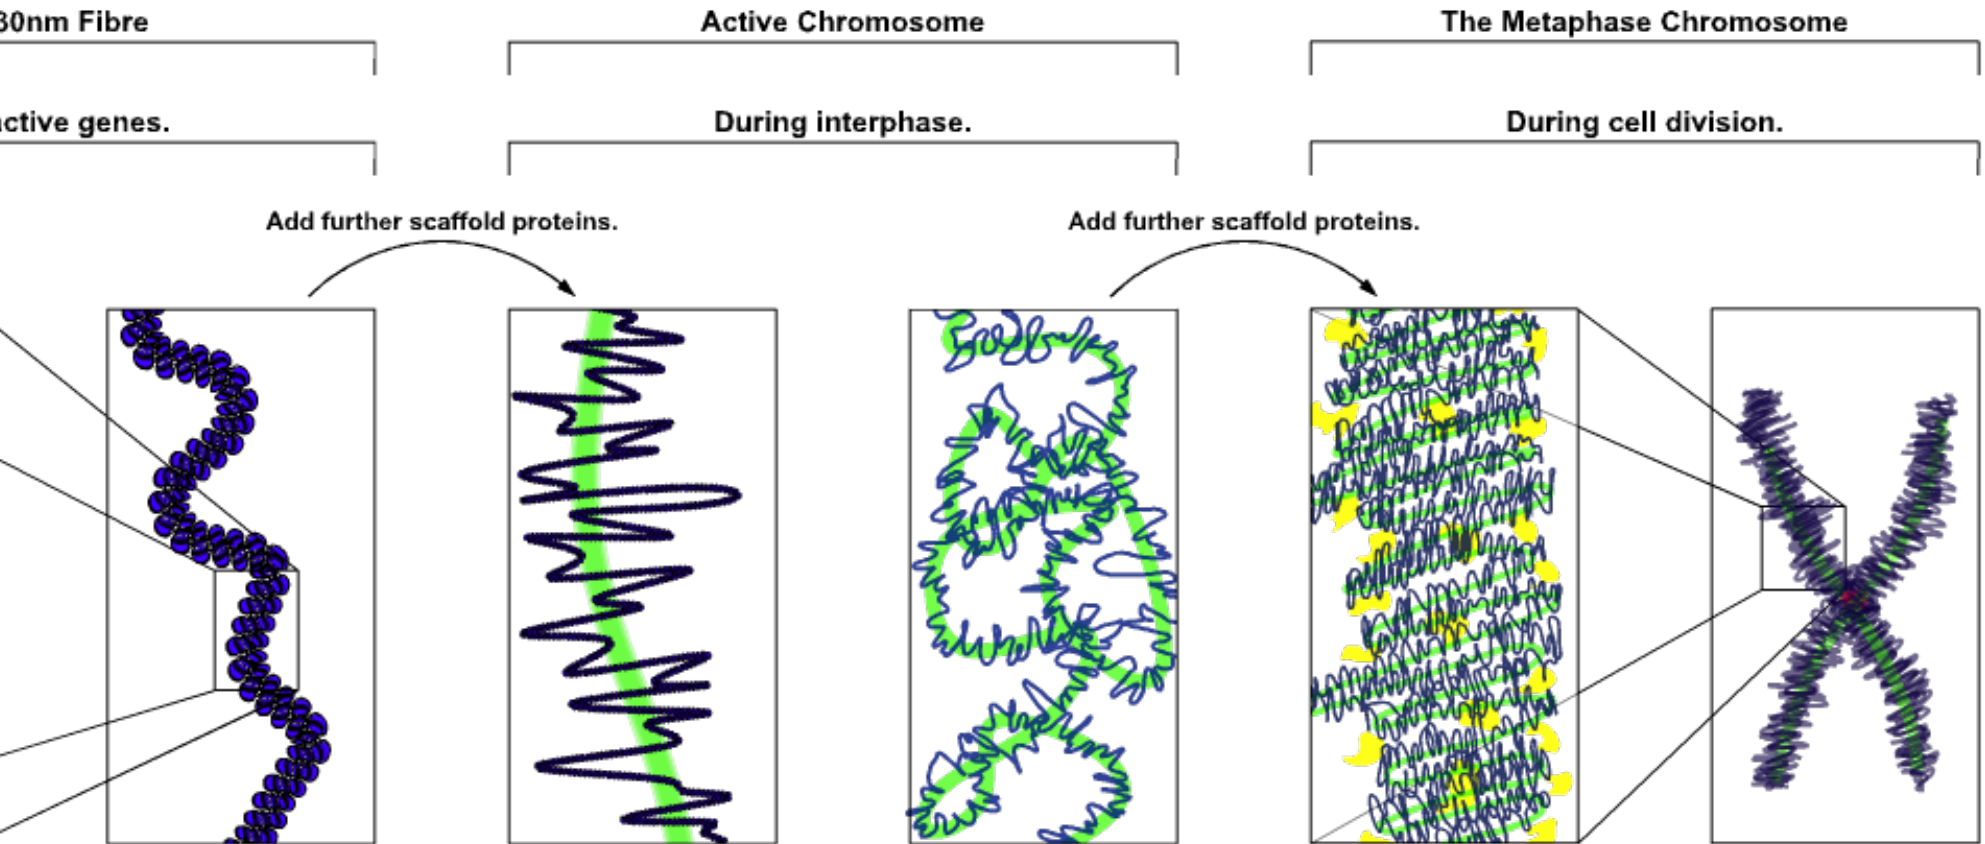

DNA wrapped around a histone particle

Levels of organization in the genome

Levels of organization in the genome

Modifications to DNA are epigenetic “punctuation marks”

Epigenetics: Punctuation. Is. Key.

STOP CLUBBING BABY SEALS!!

STOP CLUBBING, BABY SEALS!

The genome as a computational network

ENCODE:
Encyclopedia of
DNA elements

Cytosine DNA Methylation

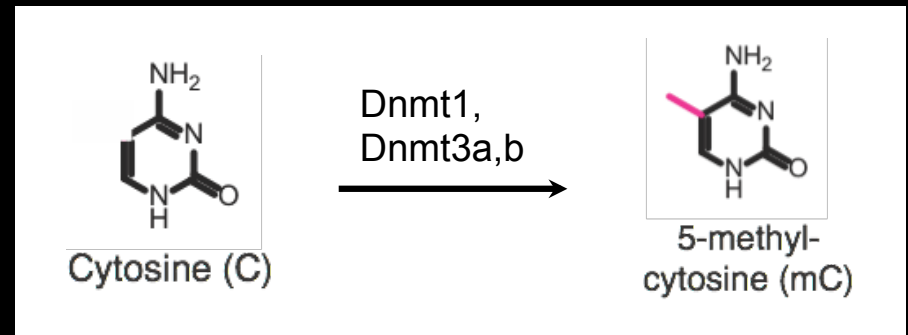

- Covalent modification of genomic cytosine (mC)
- Key roles in imprinting, X-inactivation, transcription repression, cancer
- Stable and heritable
- Yet, reversible and potentially activity-dependent
- *Rett syndrome*: An autism-spectrum disorder caused by Methyl-C Binding Protein (MECP2) loss of function

Epigenetic regulation in insects

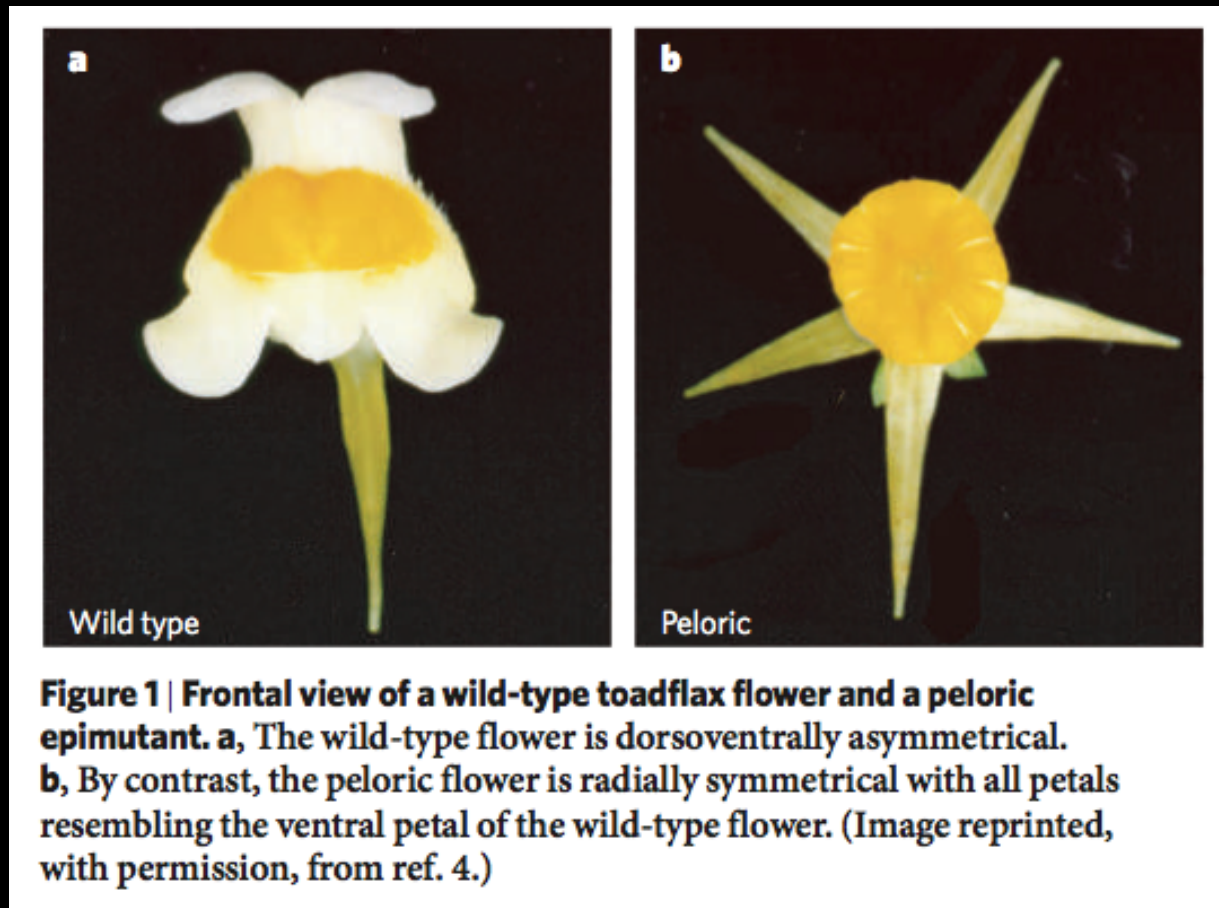

Queen and female worker bees

Royal jelly

Plants

Epimutation:

Two forms of the toadflax plant with identical genotype but different inherited DNA methylation patterns

Mammals: You are what you eat (so eat your vitamins!)

Nutrients supporting healthy methylation:

- Folic acid
- B-vitamins
- SAM (S-adenosyl methionine)

Especially important for pregnant mothers/infants

Maternal care induces life-long changes in DNA methylation and stress resilience in offspring

Low quality maternal care

↑ Stress behavior of offspring

↓ Glucocorticoid receptor (GR) expression in brain

High quality maternal care

↓

↑

GR promoter is hypermethylated in hippocampus in low-quality group [Weaver, ..., Szyf, Meaney (2004)]

Maternal Care

Offspring DNA methylation

Offspring GR expression

Offspring stress behavior

$\sim 10^6 \times$

Testing the cognitive role of epigenetic modifications requires **genome-scale, base-resolution neuronal epigenome profiling**

Studying gene networks: Shotgun sequencing

Shotgun bisulfite sequencing measures the DNA methylation landscape

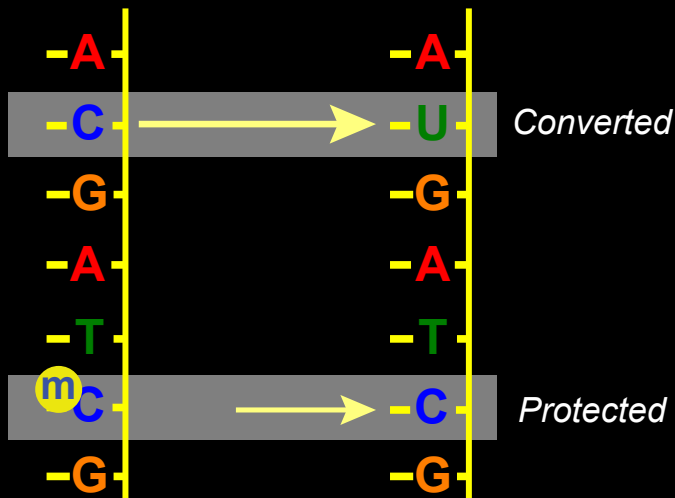

Genomic DNA

Random fragmentation

Bisulfite conversion of unmethylated C

Deep sequencing

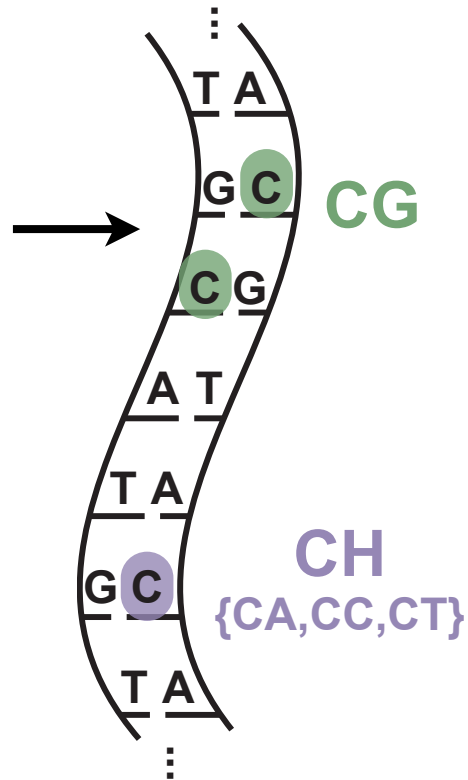

Computational analysis/statistics

$$c(\tau) = \sum_i m_i m_{i+\tau}$$

R. Lister and J. Ecker, *Genome Research* (2009)

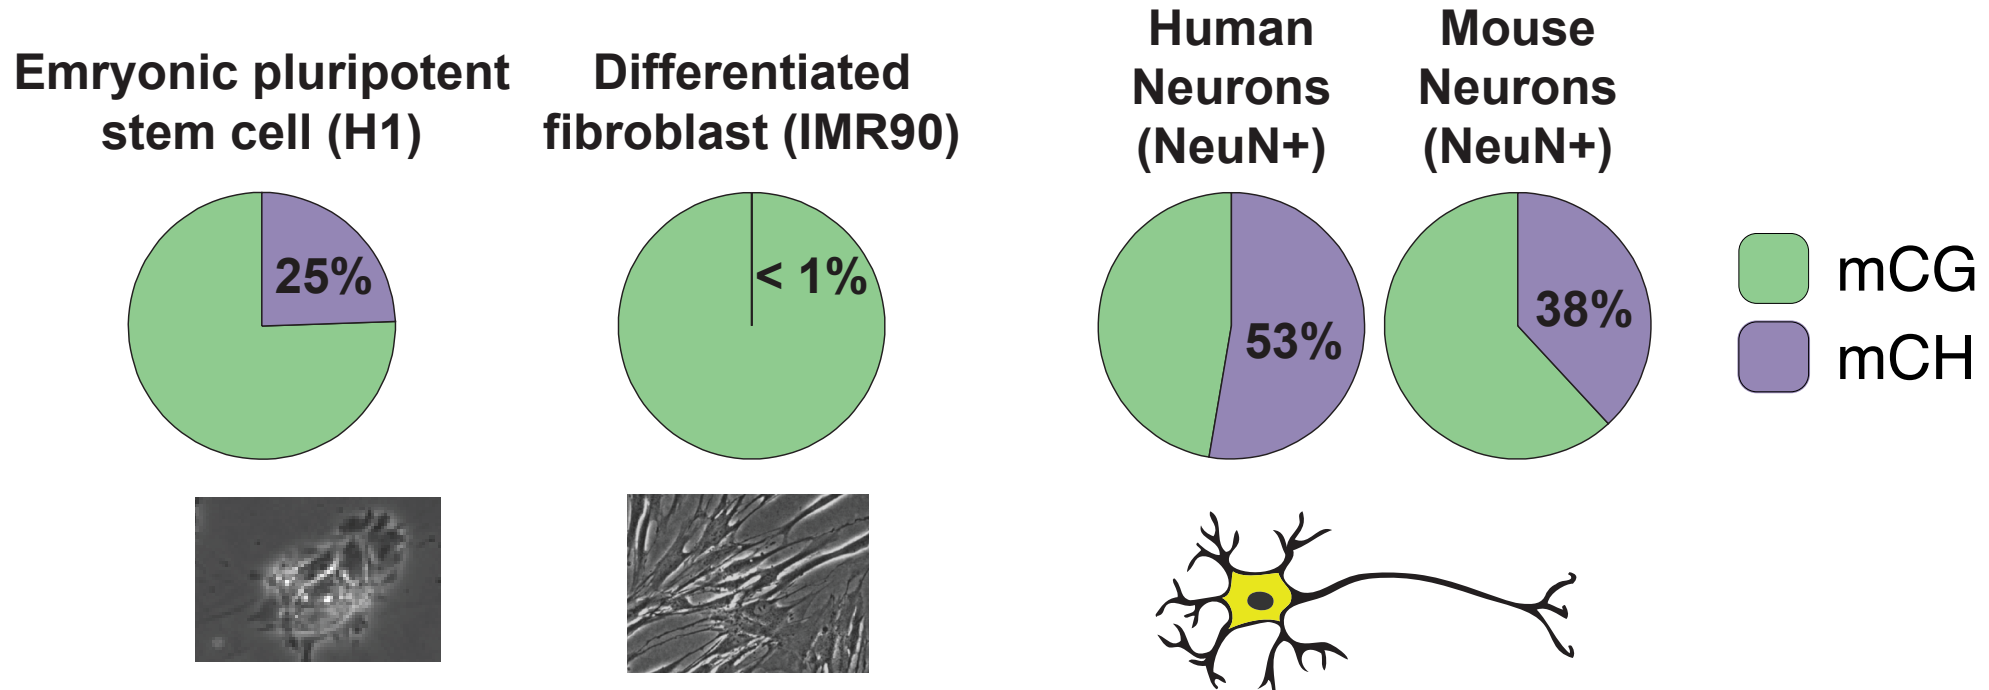

Two DNA sequence contexts for methylation

CG:
Highly methylated
in all cell types

non-CG (CH):
Generally
unmethylated
after differentiation

A surprise: Substantial non-CG methylation in neurons

R. Lister*, E.A. Mukamel* et al. *Science* (2013)

See also: Xie et al., *Cell* (2012); Zeng et al., *Am. J. Hum. Gen.* (2012)

How does methylation accumulate during brain development?

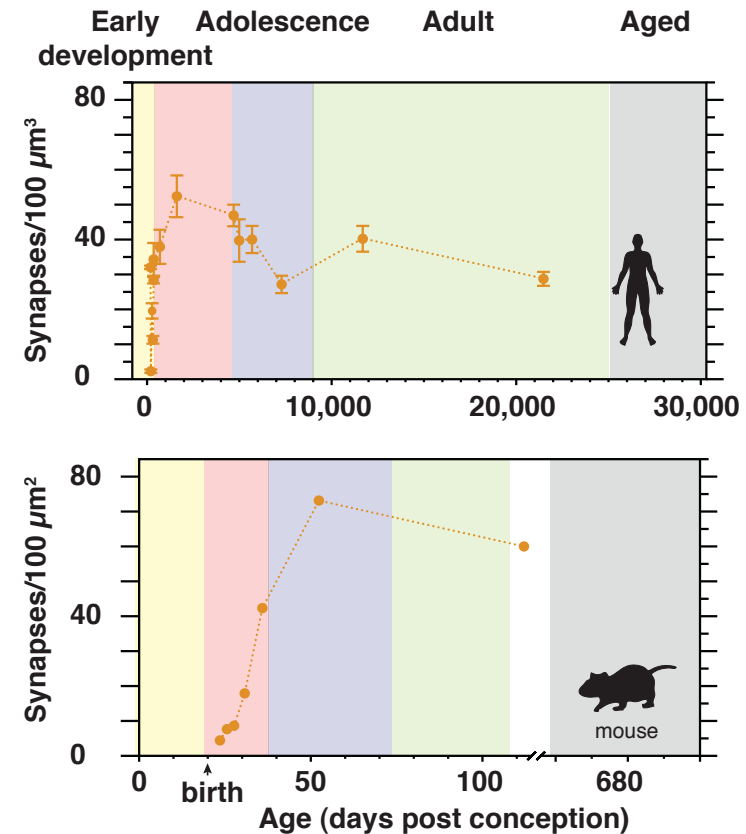

mCH

?

mCH

Tau and Peterson, B.S. *Neuropsychopharmacol.* (2009).
 S.L. Anderson. *Neurosci. and Behav. Rev.* (2003)

DeFelipe *et al.* (1997);
 Huttenlocher *et al.*, (1997)

Non-CG methylation accumulates throughout childhood and adolescence

Non-CG methylation increases during years 0-16, coinciding with synaptogenesis and pruning

Methylation patterns are strongly conserved between individuals

Conservation suggests there could be a biological function

However, there is no causal evidence yet (stay tuned)

Does DNA methylation contribute to brain cell diversity?

Drawing of auditory cortical neurons, Ramón y Cajal (1899)

Fluorescently labeled neurons and glia, Livet, Sanes, and Lichtman (2007)

Cell types have unique DNA methylation fingerprints

Transcription factor MEF2C:

- Implicated in neurogenesis and cortical development
- Hypermethylated (*i.e.*, repressed) in glia

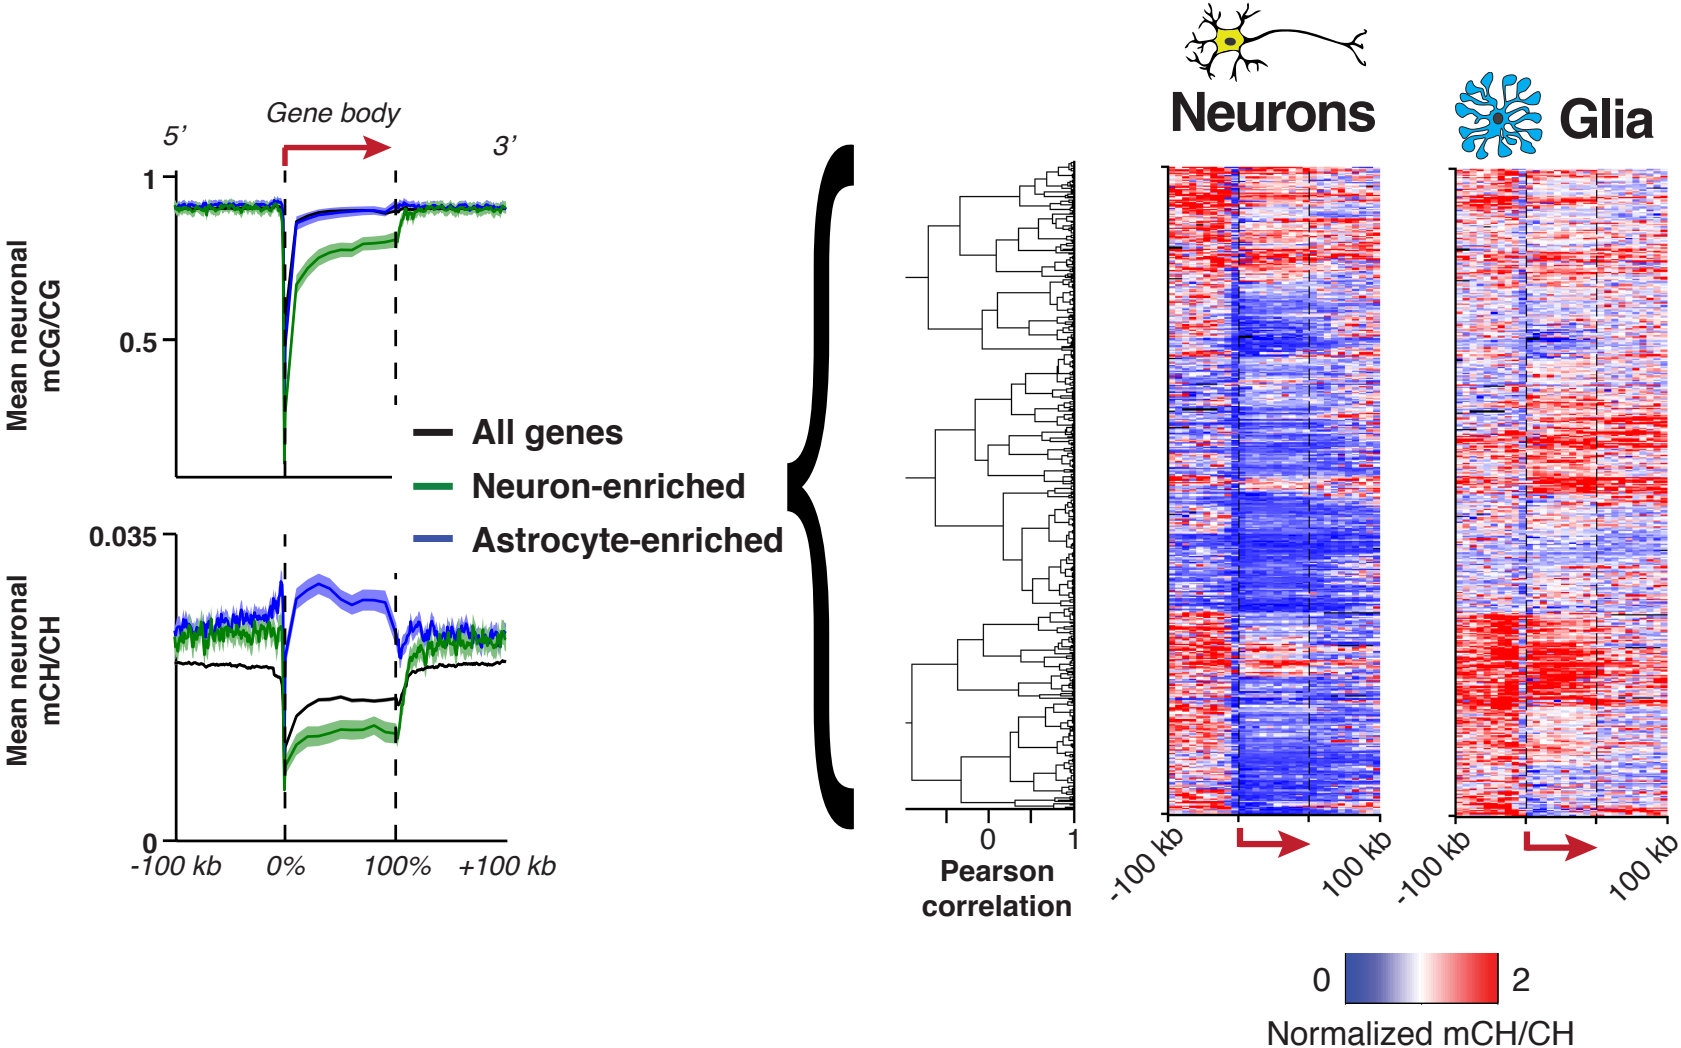

mCH is a characteristic feature of neurons, not astrocytes

Non-CG DNA methylation is a specific feature of mature neurons

Identifying gene methylation patterns is a “Big Data” challenge

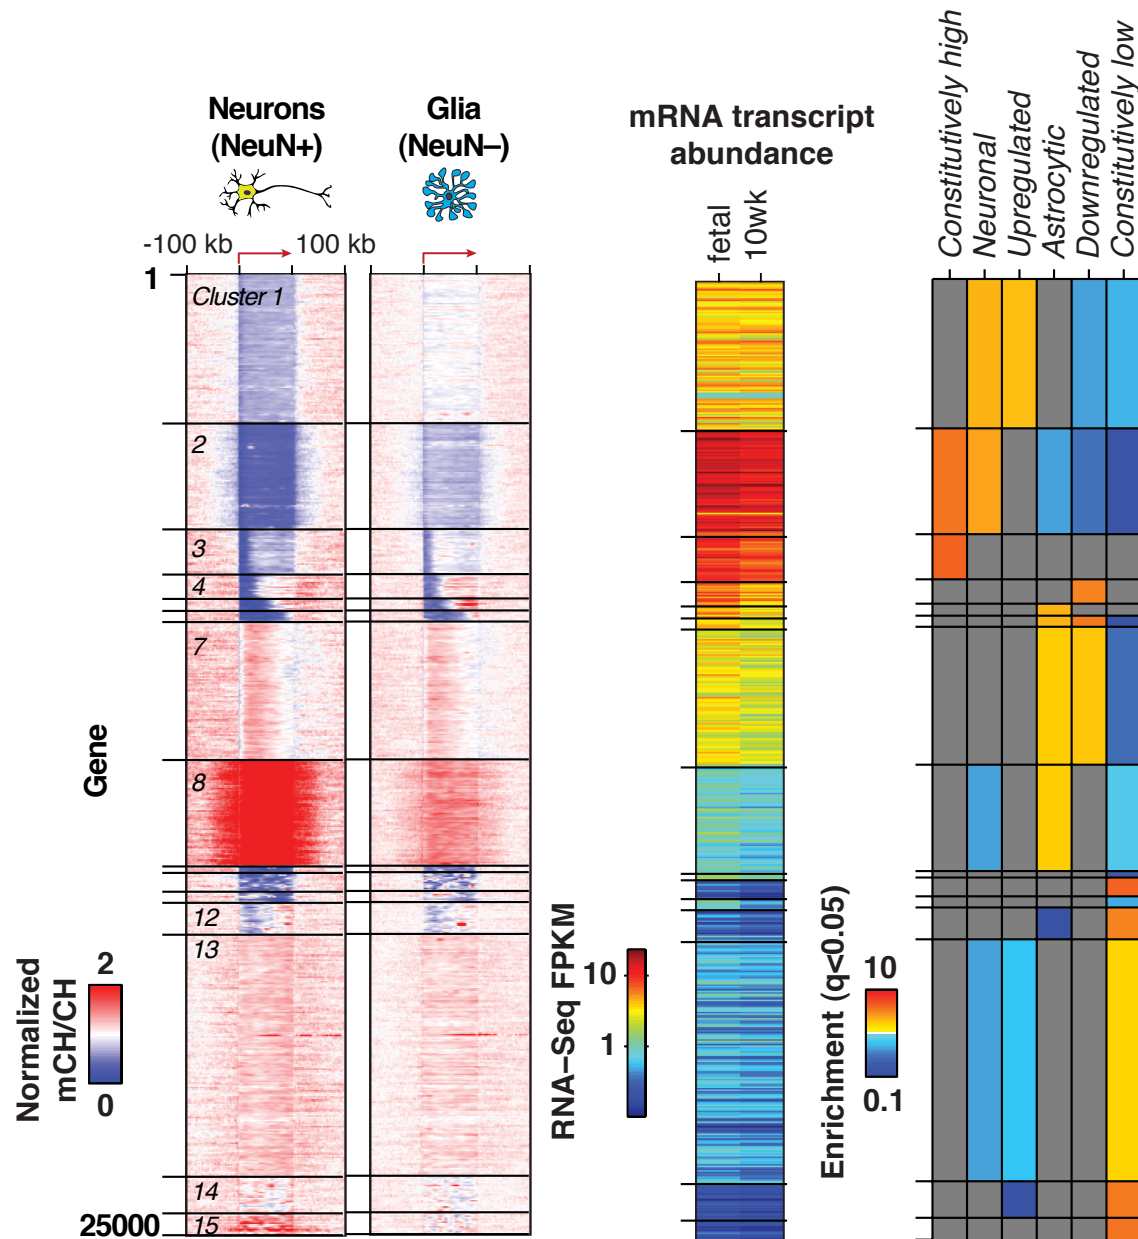

Unbiased clustering of methylation profiles identifies distinct gene sets

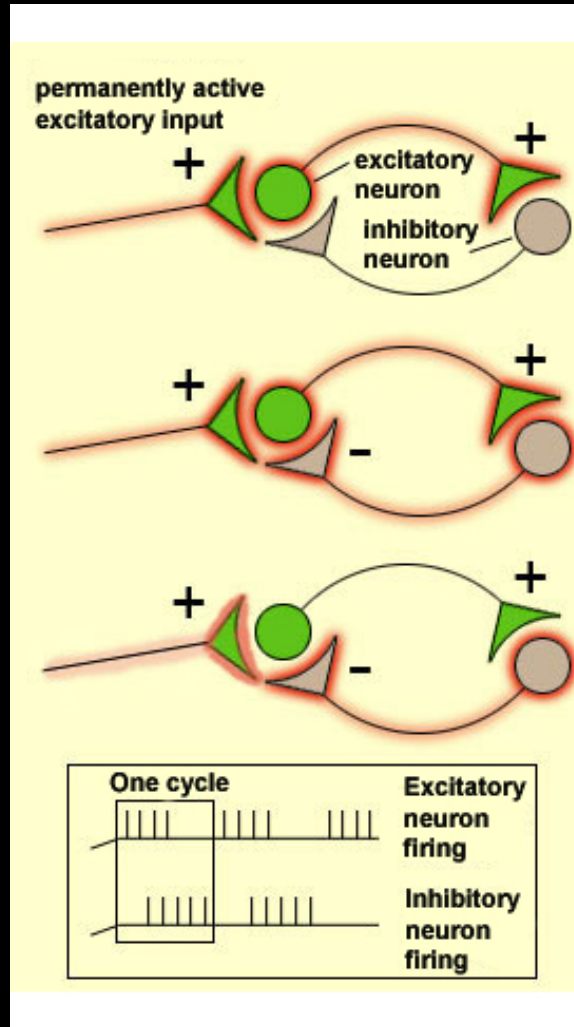

Principal component (PC) analysis of genome-wide methylation patterns

Unbiased clustering of methylation profiles identifies distinct gene sets

Sub-types of neurons: Excitatory and inhibitory cells create balance

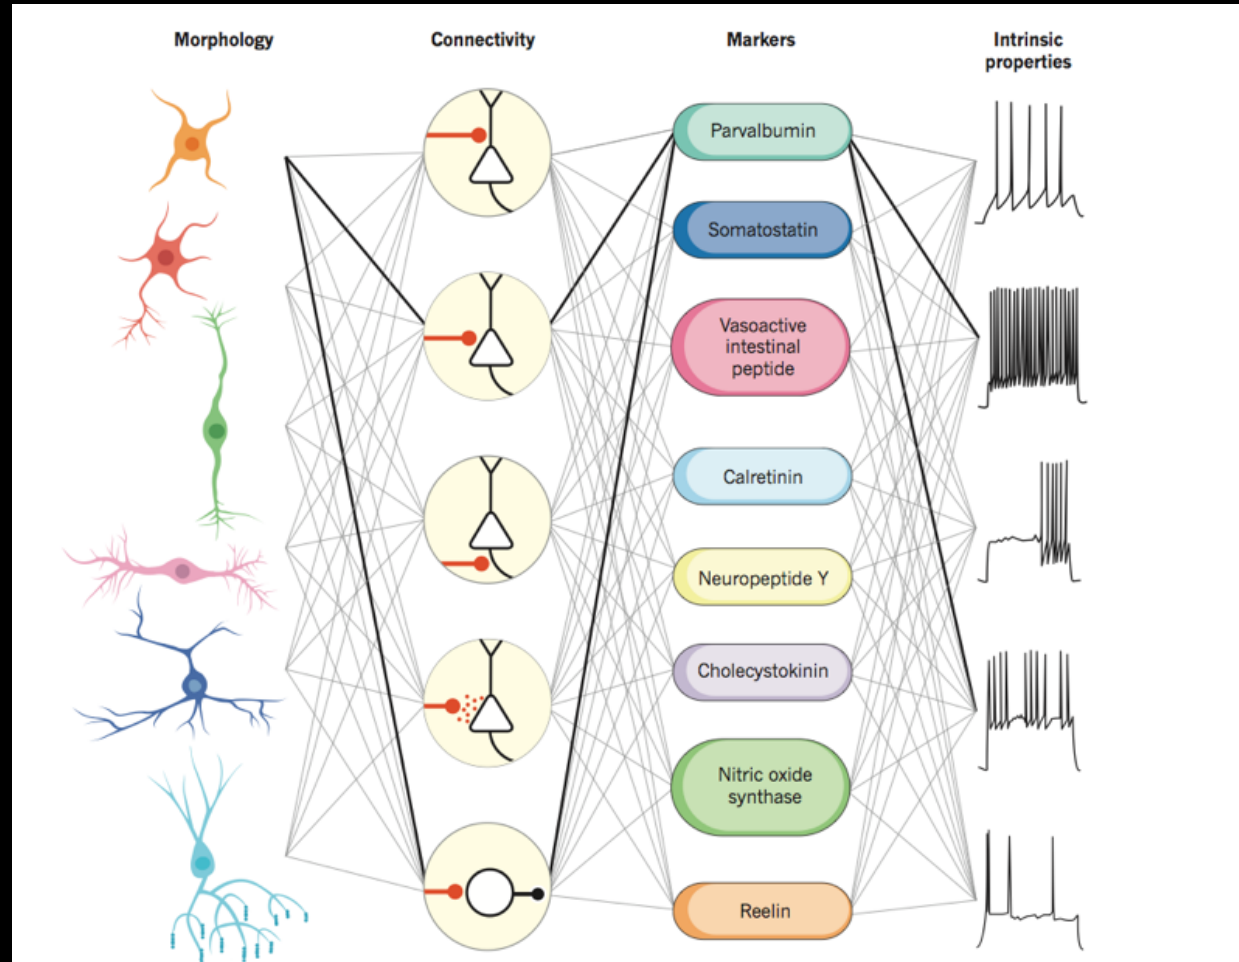

Excitatory and inhibitory neurons: Natives and immigrants

Excitatory cells
radiate upward
within cortex

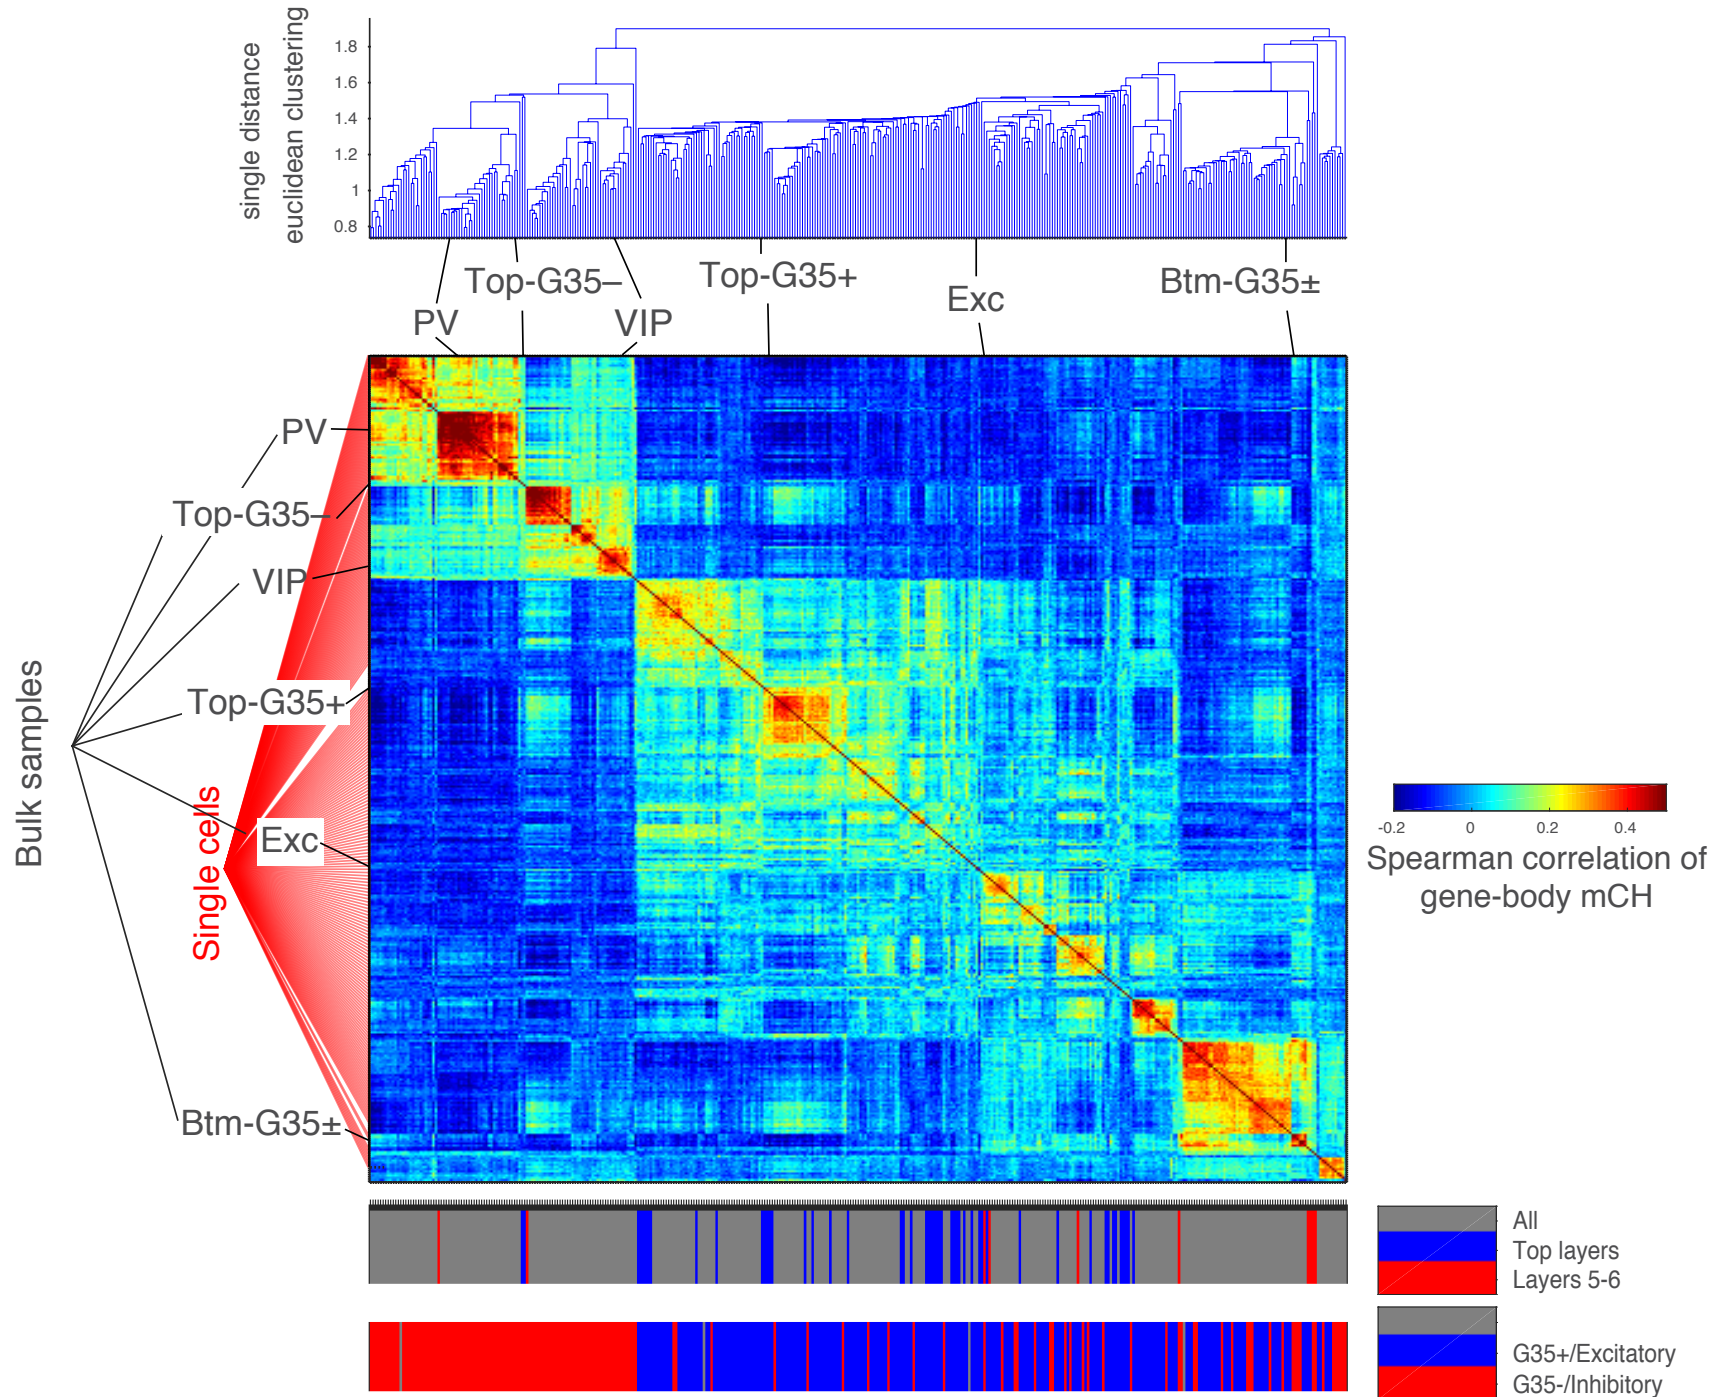

Inhibitory
cells migrate
to the cortex

What is the DNA methylation landscape in major neuron cell types?

Classification of inhibitory interneuron cell types
Kepecs, A., & Fishell, G. (2014). *Nature*, 505(7483), 318–326

Cluster analysis of 411 single cells + 14 bulk methylomes

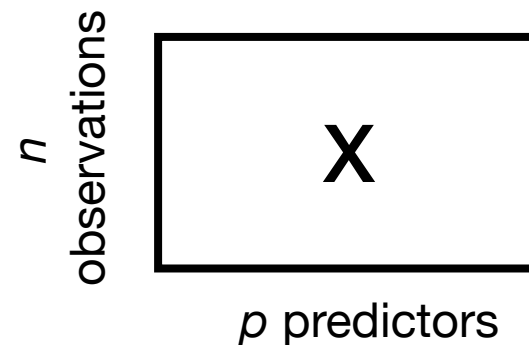

Data dimensionality

- A dataset with p “features” (e.g. genes) and n “observations” (e.g. cells)
- If both p and n are large ($>1,000$), it becomes difficult to visualize, analyze and interpret the data

Low-dimensional data, $n \gg p$

High-dimensional data, $n \leq p$

Dimensionality reduction by Principal Components Analysis (PCA)

- Principal components analysis (PCA) projects high-dimensional data onto a smaller number of “most interesting” dimensions

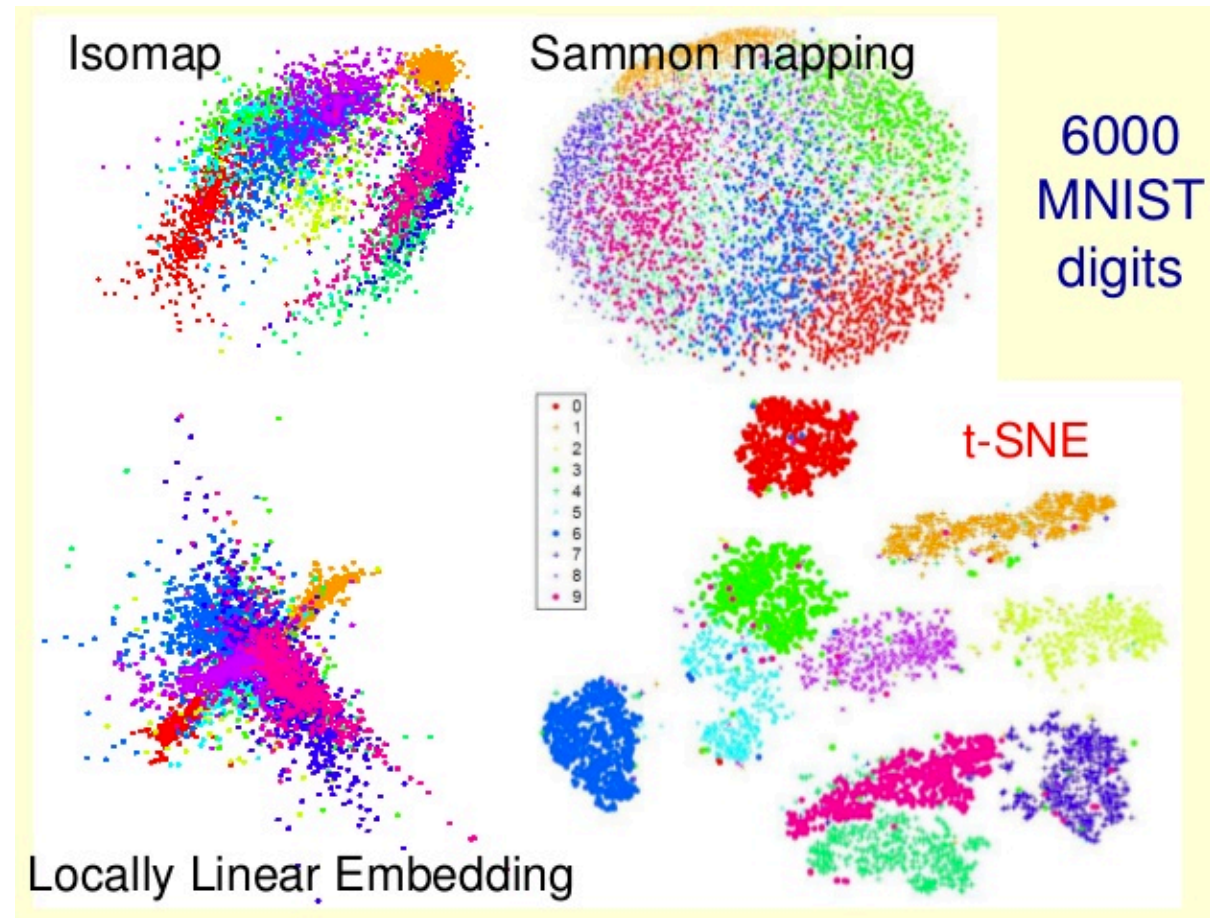

Example: Projection of 3D global geography onto 2D maps

tSNE (t-Stochastic Neighbor Embedding)

Visualizing cells in a high-dimensional space

Linear and non-linear dimensional reduction

Principal components analysis

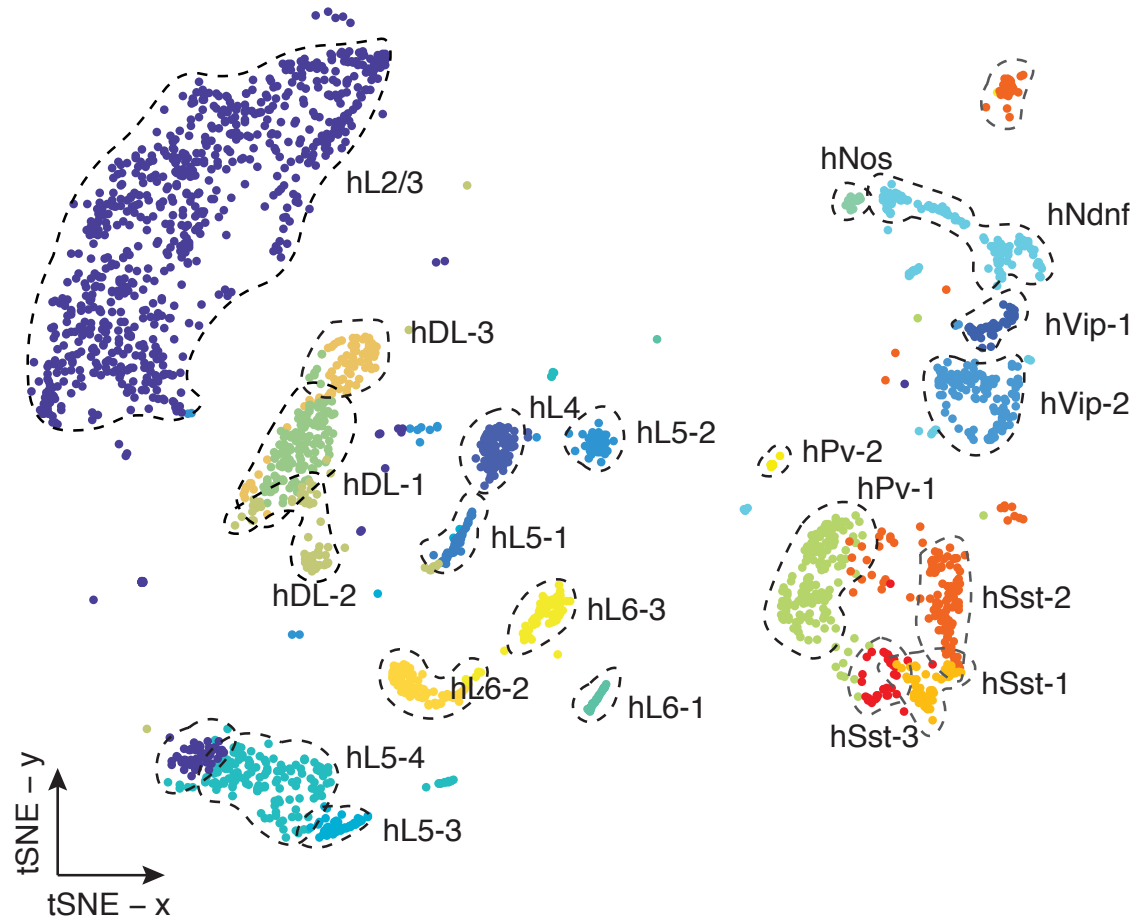

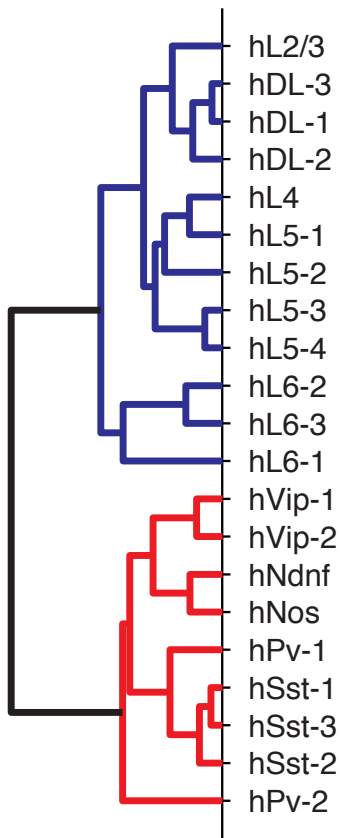

t-Distributed stochastic neighbor embedding

(van der Maaten, Hinton 2008)

tSNE visualization of single human neurons

Hierarchical clustering of human neuronal clusters

Example: Adgra3 is a novel marker of PV+ interneurons

G

Overlap of double ISH signal

How many cell types are there?

Lumpers vs. Splitters

It is good to have hair-splitters & lumpers

(Darwin, 1857)

Splitters make very small units – their critics say that if they can tell two animals apart, they place them in different genera ... and if they cannot tell them apart, they place them in different species. ...

Lumpers make large units – their critics say that if a carnivore is neither a dog nor a bear, they call it a cat

(George Simpson, 1945)

Determining cell types through the integration of multi-modal datasets

Chromatin accessibility
snATAC-Seq

Transcriptome
snRNA/scRNA-Seq

DNA methylation
snmC-Seq

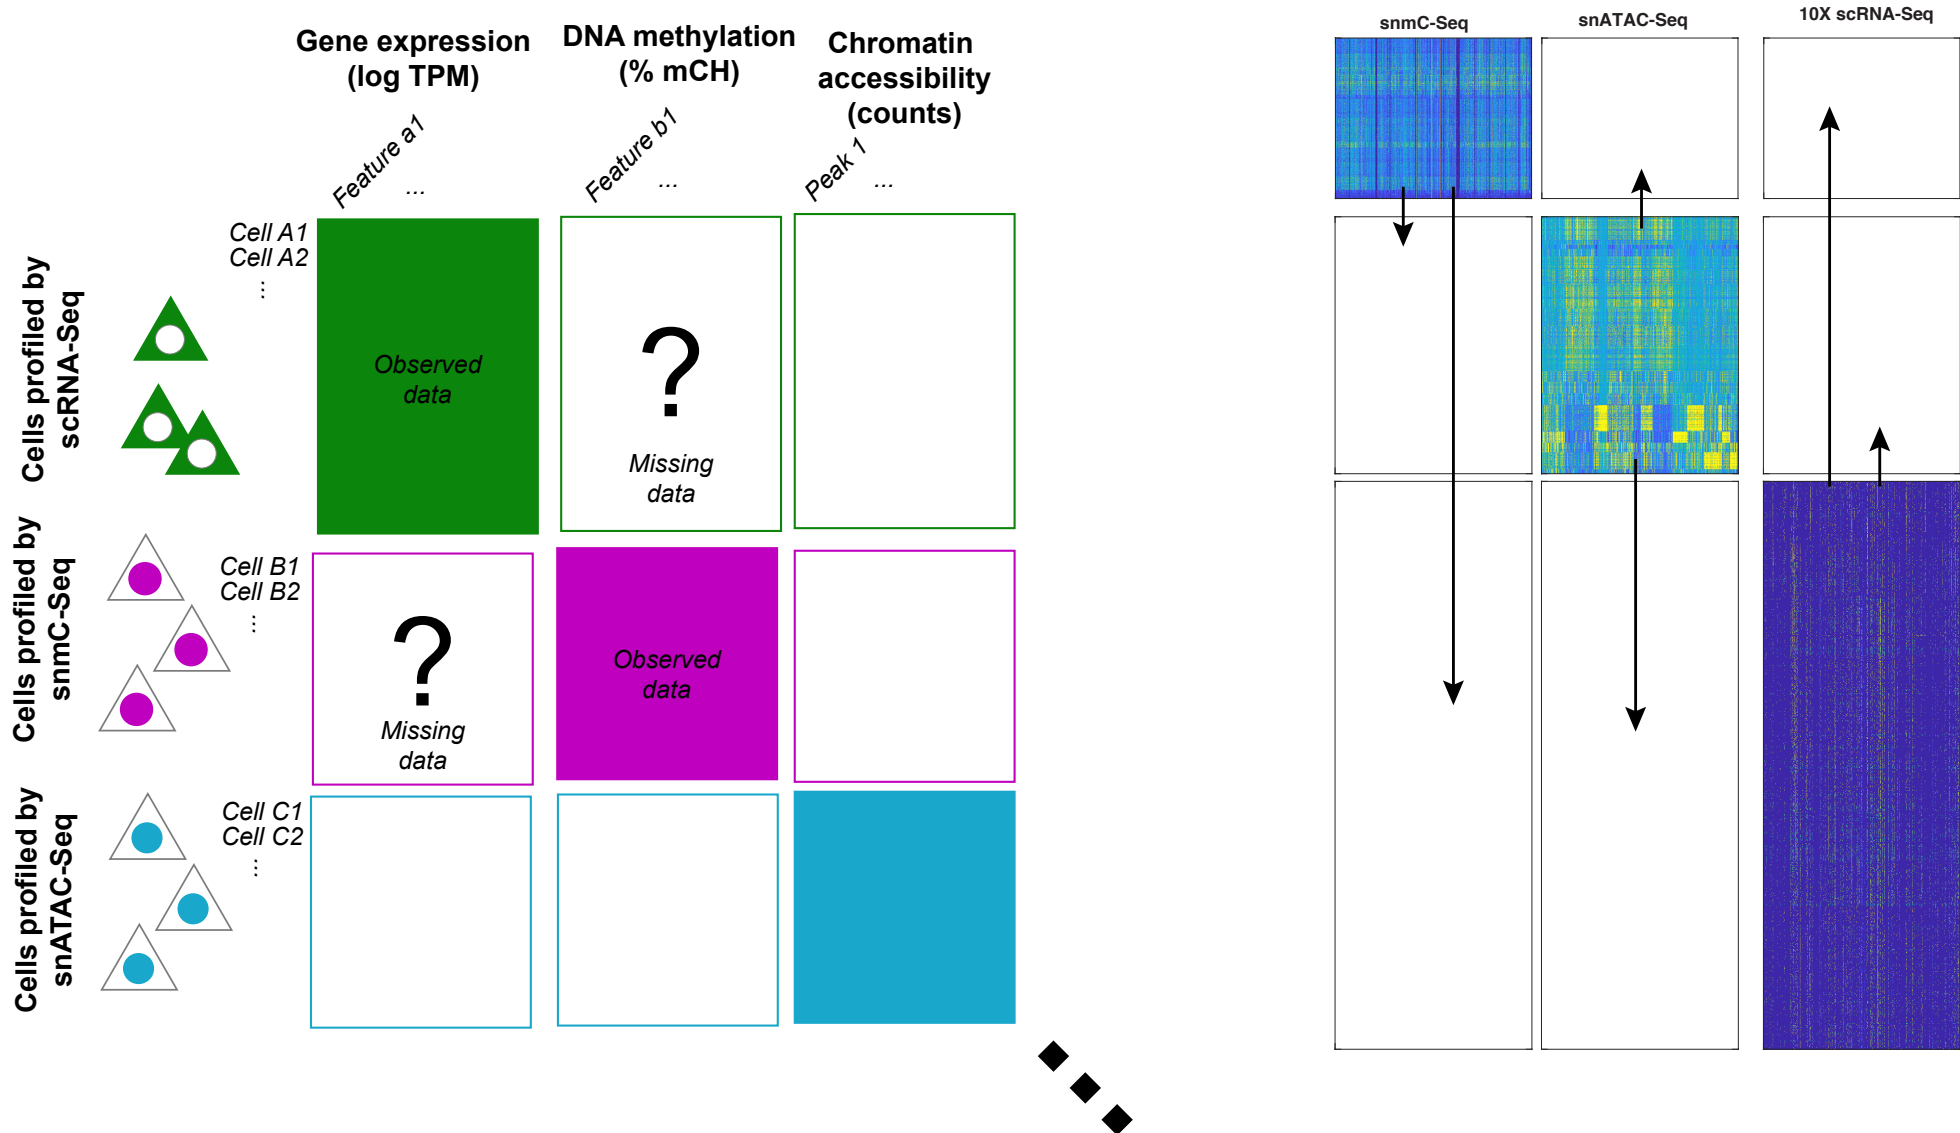

Determining cell types through the integration of multi-modal datasets

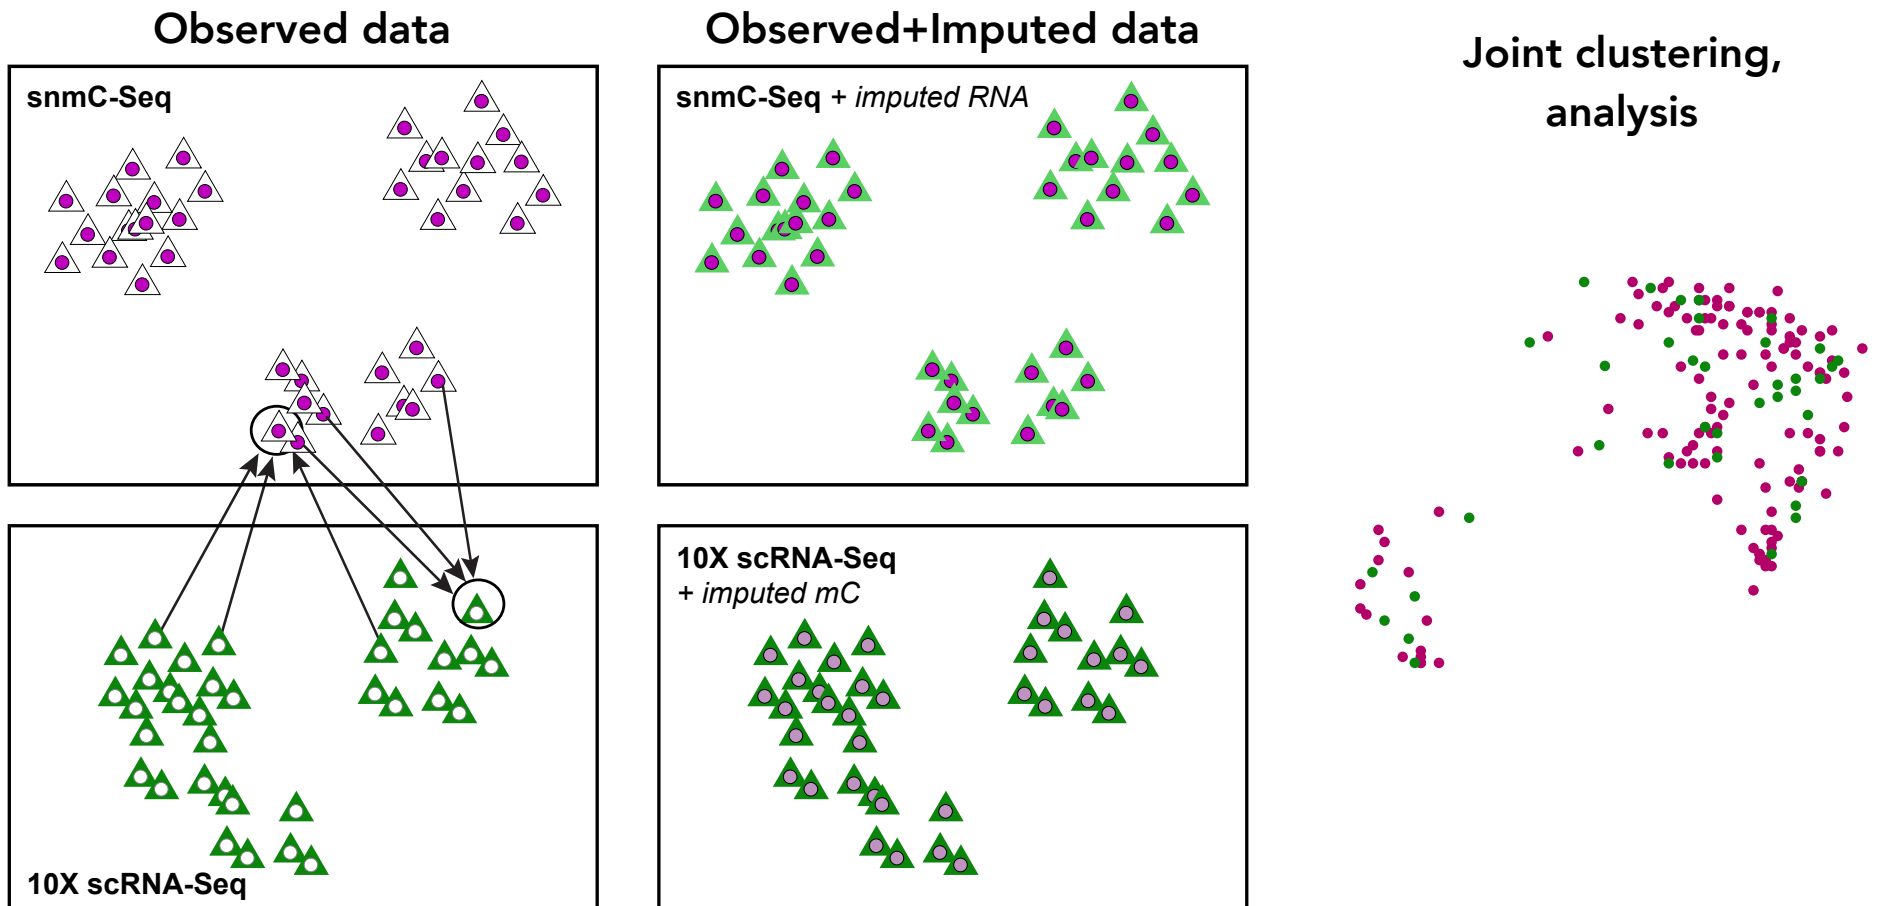

**Cell type defined by
multiple modalities**

- Directly link transcription and epigenetic regulation in the same cell type
- Provide cross-modal validation of cell types predicted from one data modality
- Provides foundation for functional cell types

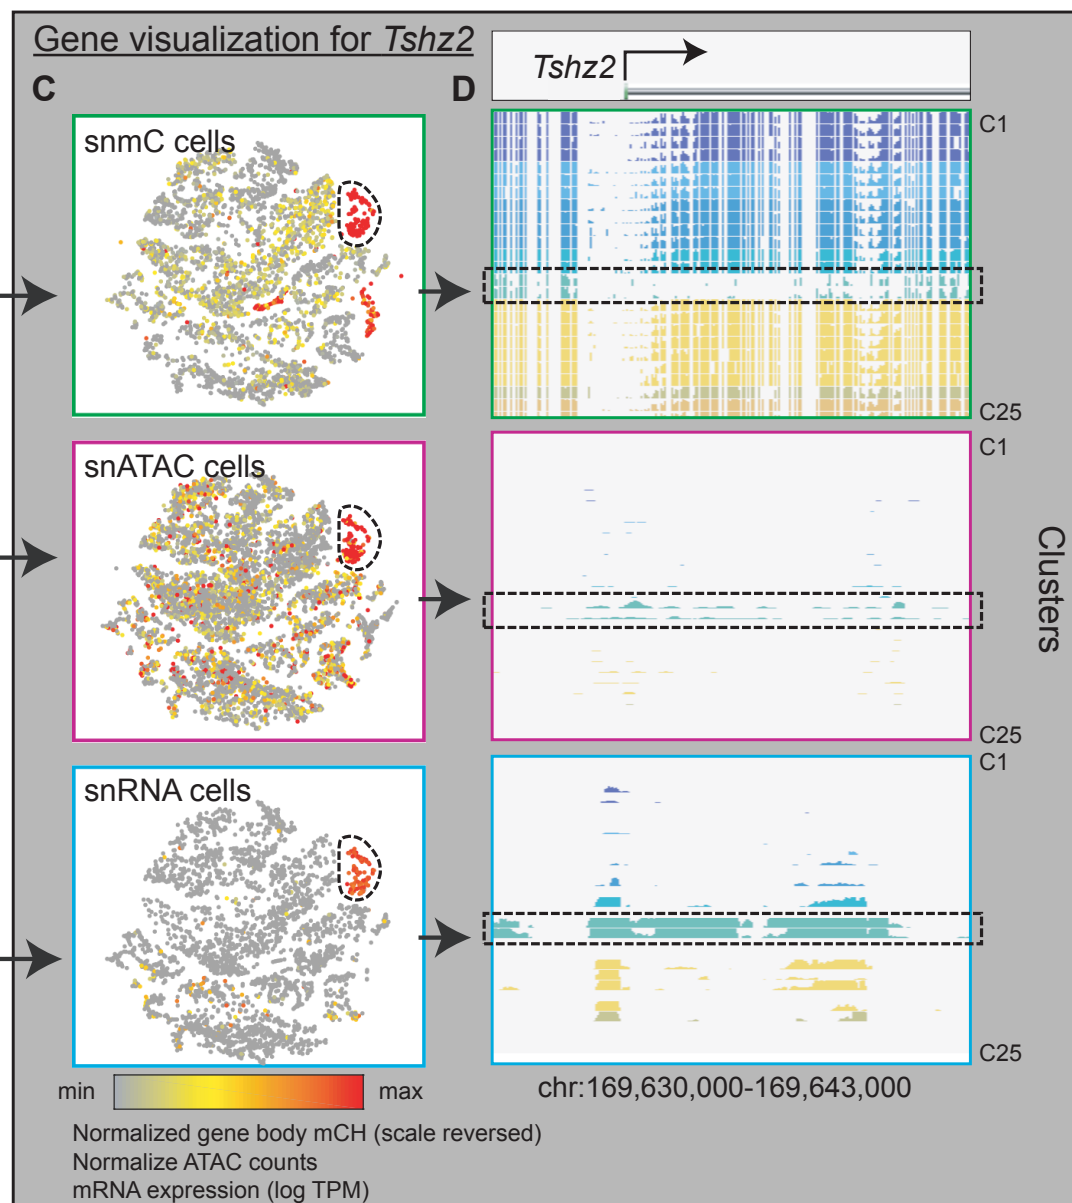

Multi-omics data integration requires imputation

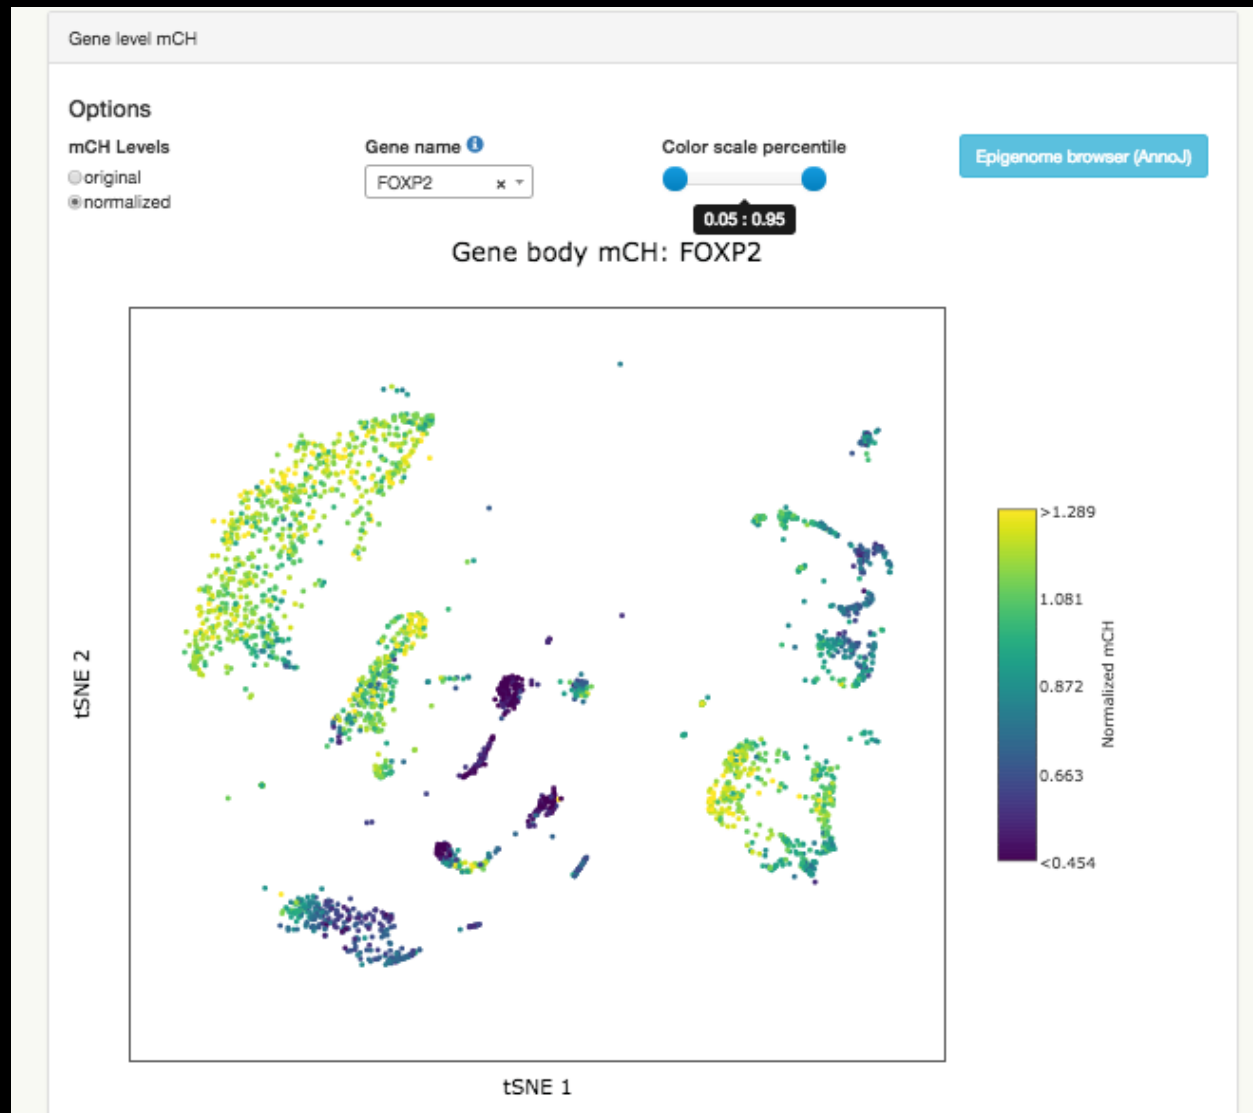

Cross-modality data fusion by *Bigraph Imputation*

- For each cell in modality A, find K neighbors in modality B
- This requires a *linking assumption*, e.g. low gene body mCH corresponds with high mRNA expression
- Use neighbors to impute missing information for A

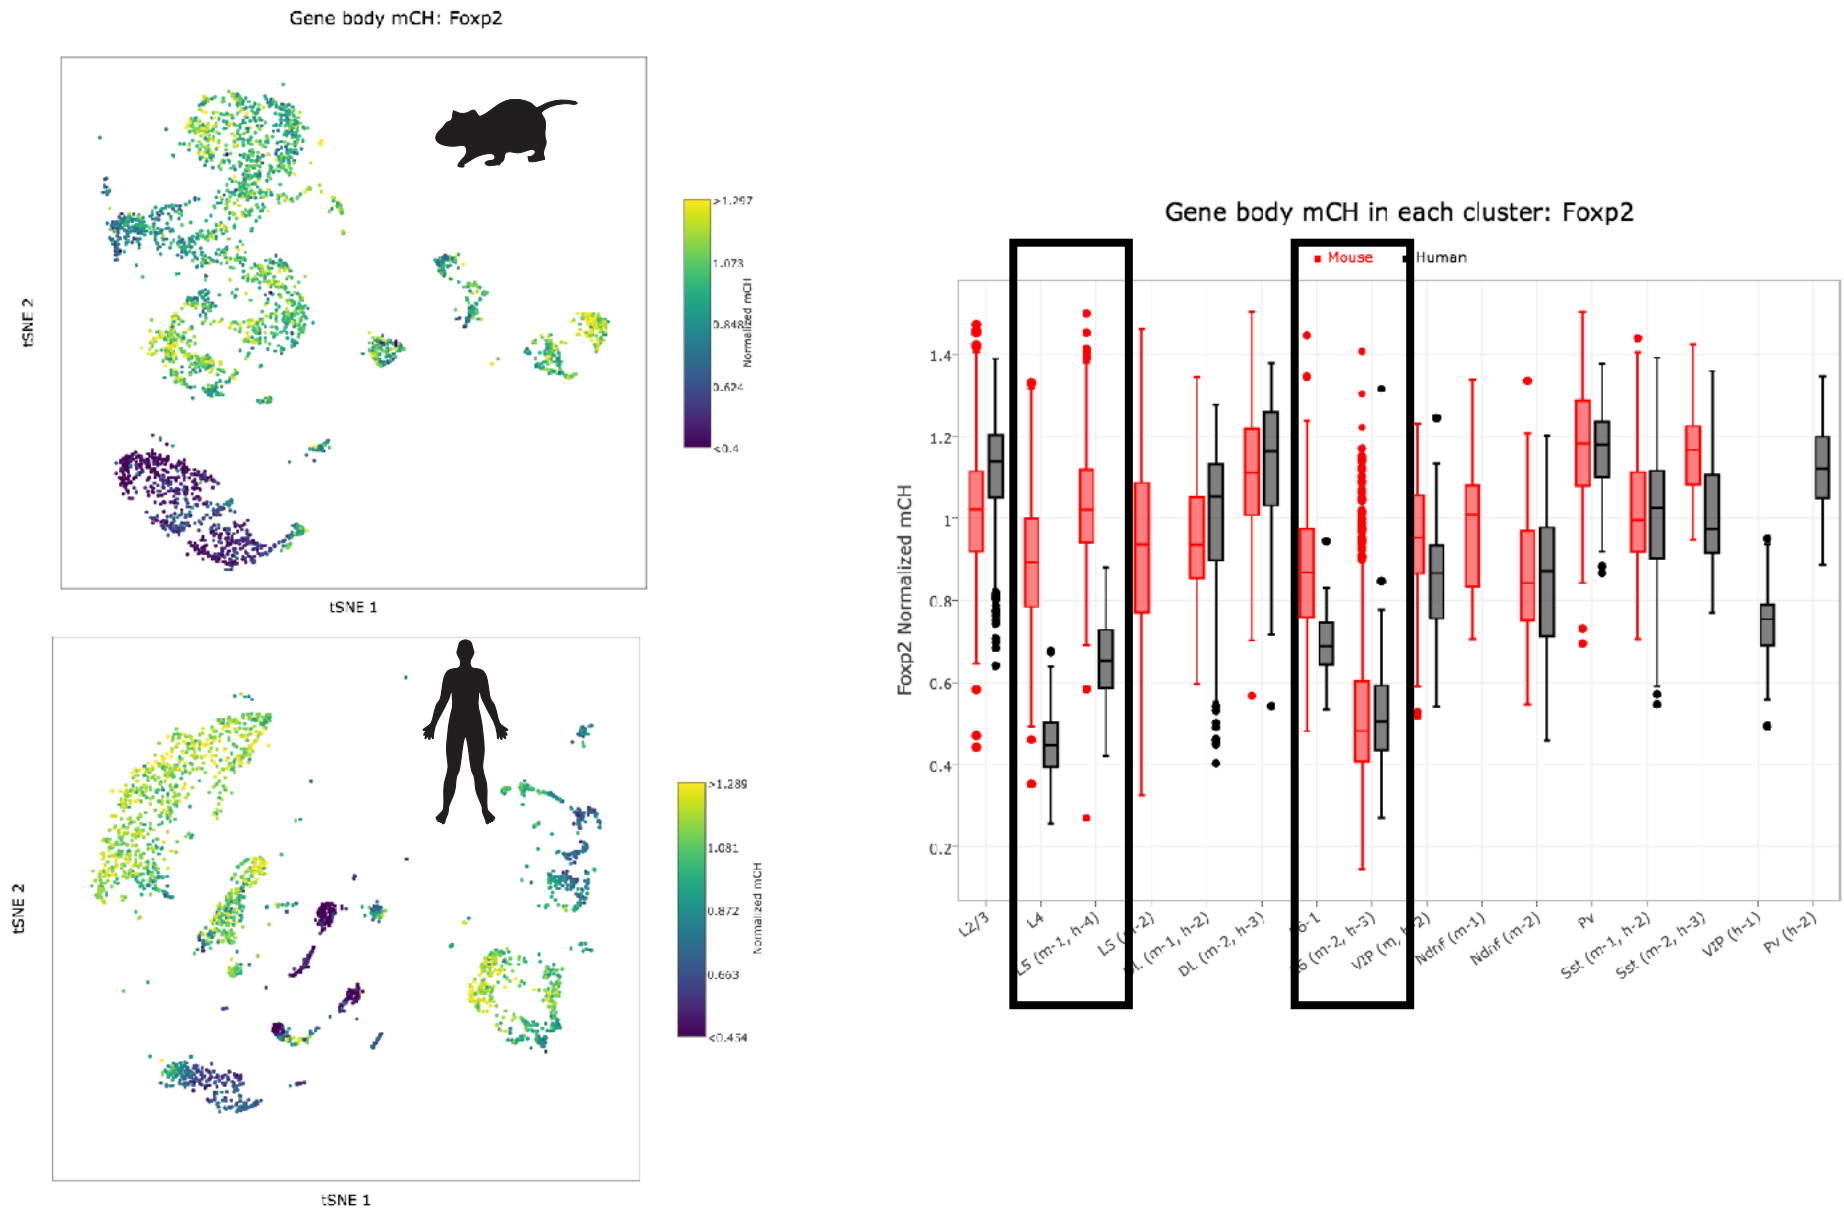

Exploring cell type specific DNA methylation patterns with interactive data visualizations (<http://brainome.org>)

FOXP2: A “language gene”?

- Mutations in FOXP2 linked to language disorders (verbal dyspraxia)
- Also linked with vocalization in songbirds

FOXP2 (associated with language) is expressed in different cortical layers in mouse and human frontal cortex

~60M years of evolution led to greater divergence in excitatory compared with inhibitory neuron epigenomes

Cross-species correlation of mCG at CG-DMRs

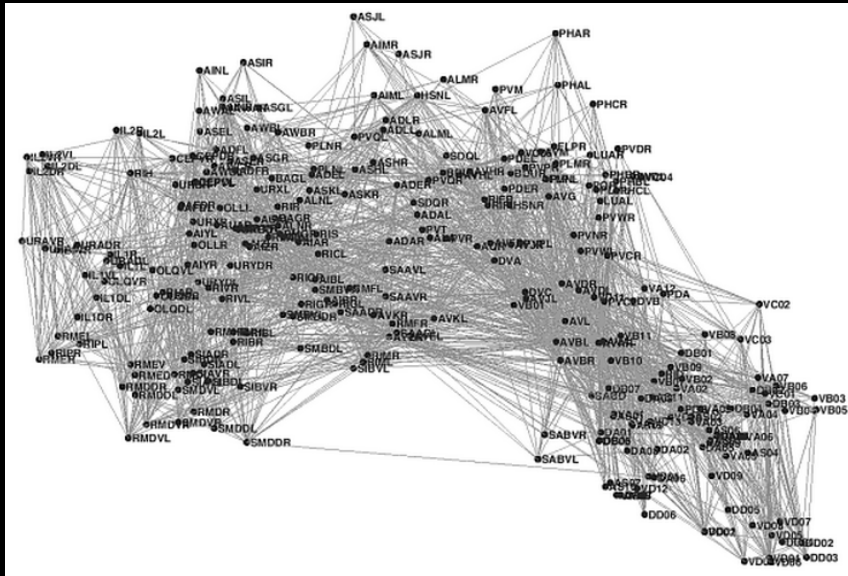

Sequence conservation of excitatory and inhibitory neuron CG-DMRs

Complex biological networks: Genes and Brains

Brains (neural networks)

C. Elegans connectome (1986)

Genomes (gene networks)

Encyclopedia of DNA Elements (ENCODE) (2012)

| ✓ | Enable complex, recurrent interactions | ✓ |

Take-home message

The methylation status at ~1 billion cytosines in the genome is potentially an information-rich, stable yet flexible substrate for information storage/processing

Open questions:

- *Functional role of mCH?*
- *Differences between 100s of neuronal subtypes?*
- *Impact of experience/learning?*
- *Disruption in neuropsychiatric disorders?*
